

Panel Session

Industrial Application of Object Technology

Moderator: Kiwon Chong
SoongSil University

The influence of object technology seems to be expanded to a variety of applications. Software factories also face a great impact. Object-oriented development methodologies are expected to eventually take over the structured methodologies. However, many practitioners feel that it is very hard for them to have a transition to object-orientation. This panel will focus on the technology status and trend of object-orientation, industrial experiences of object technology, whether methodologies are going to be unified or the methodology war has just begun, industry responses on object-oriented CASE tools, reuse and reengineering issues, and others.
