Message from the Organization Committee

The third Architecture-Centric Virtual Integration (ACVI) workshop presents the last work and research outcomes on Architecture Modeling and Virtual Integration. As cyber-physical real-time embedded systems are growing and getting more complex, these technologies are getting more attention and evolving at an increasing pace.

In this edition, we have papers that present technologies applying virtual integration concepts for different domains and with different modeling languages. It provides a good overview of all the existing technologies and how they are apply to validate several attributes of the system, such as security, safety or timing.

We hope you will enjoy this workshop as much as we do.

Julien Delange, Peter Feiler and Jerome Hugues
